Quality Control Data

A sample kit was tested to ensure the quality and performance of this lot. 360 ng of the *E. coli* genomic DNA was mixed with 0.36 ng of Hae III-digested φX174 DNA. The subtraction procedure was performed according to the User Manual using this mixture as tester DNA and *E. coli* Genomic DNA alone as driver. Adaptors 1 and 2R were ligated to the tester DNA, and two consecutive hybridizations were performed with tester and driver DNAs. The Advantage® 2 PCR Kit (Cat. No. 639206) was used for PCR. Primary PCR was performed using PCR Primer 1; secondary PCR was performed using Nested Primers 1 and 2R. The reaction products were examined by electrophoresis on a 2% agarose/EtBr gel. The resulting bands corresponded to the Hae III-digested φX174 DNA fragments only.
