Description

The ICELL8 cx Single-Cell System JPN is an advanced, integrated automation platform that combines the power of imaging and dispensing with the isolation of single cells in 5,184-nanowell chips. The ICELL8 cx system employs a large-bore nozzle dispenser for unbiased cell size isolation. Imaging allows the differentiation of single cells from multiple cells. Additionally, with the use of fluorescence, imaging can also be used for live/dead analysis in conjunction with the use of cellular dyes. The full system also includes a built-in imaging station and integrated ICELL8 cx CellSelect® Software that analyzes the images and provides the ability to proceed only with chosen wells, eliminating the noise from multiple-cell-containing wells or empty wells. This open-platform, high-throughput single-cell automation system is prevalidated for use with several NGS applications and also provides the flexibility to enable users to develop applications of their choice.
