QUALITY CONTROL DATA

Each total RNA lot included in the panel was individually analyzed by one of the following methods:

- Capillary electrophoresis (CE) using an Agilent 2100 Bioanalyzer, or
- Denaturing formaldehyde agarose gel electrophoresis

Agilent 2100 Bioanalyzer method and criteria:

For samples tested by this method: Each individual lot of total RNA was analyzed by capillary electrophoresis (CE) using an Agilent 2100 Bioanalyzer. RNA concentration and purity were evaluated by UV spectrophotometry. Both the area ratio of the 28S/18S rRNA peaks, and the proportion (relative percentage) of these two peaks area to the total area under the electropherogram provide reliable quantitative estimates of RNA integrity. For both of these criteria, this sample meets or exceeds Clontech standards for high quality total RNA.

Denaturing formaldehyde gel method and criteria:

For samples tested by this method: After electrophoresis on a denaturing formaldehyde gel, each individual lot of RNA was found to have distinct 28S and 18S ribosomal bands. RNA concentration and purity were evaluated by UV spectrophotometry.
