DNA Single Index Kit - 12S Set B

Quality Control Data

All primers were purified by PAGE and verified by ESI analysis.

All primers were functionally tested with 200 pg of 200 bp-sheared human genomic DNA using the ThruPLEX DNA-seq Kit to produce indexed libraries. The libraries were pooled, purified, quantified, and then sequenced on the Illumina sequencing platform. The following parameters were measured for libraries prepared with all individual primers and the respective 'pass' criteria is stated:

Test Parameters	Result (%)
qPCR end-point fluorescence (%CV)	≤20
% Coverage (%CV)	≤20
Read pairs examined (%CV)	≤20
Barcode balance as min/mean (%)	≥40

It is certified that this product meets the above specifications, as reviewed and approved by the Quality Department.
